

30 DAYS OF CODE (PYTHON TRACK)

Day 19 - Find the edit distance for two strings

The edit distance between two words is the number of operations that need to be carried out to transform one into the other. e.g. The edit distance between goat and float is 2 since all we have to do is change g to l and insert f in front **OR** remove f and change l to g.

Create a function named **find_edit_dist** that **takes in two strings as input parameters** and **returns their edit distance**.

N.B: No in-built module should be used.
