

#30DaysOfCode | Backend Track

Day 26

Literature Review

Using Postman, Swagger or another API documentation tool:

Create an API documentation for the Wallet Service you implemented earlier. The documentation will contain for each route:

1. Route implemented (http method and URL)
2. Fields to be sent in the request
3. Fields to be received in the response
4. Fields that are required
5. Example of successful request and response
6. Example of failed request and response

>> All requests and responses in JSON.

>> Refer to Google, Youtube, StackOverflow and Npm for help.

>> Microsoft Office may be used in the absence of Postman and Swagger but may be more tedious.
